Definition: Robot

“A *mechanical device* that sometimes resembles a human and is capable of performing a variety of often complex human tasks on command or being programmed in advance.”

“A *machine or device* that operates automatically or by remote control.”

American Heritage Dictionary

Definition: Robotics

Science and technology of robots.

◇ Function block description:

- C*: Control (Kinematics, dynamics, control)
- A*: Actuators (Motors, drives, servos, and transmissions)
- M*: Mechanisms (Synthesis and design)
- S*: Sensors (Signal processing, estimation, data fusion)
- F*: Feedforward (Motion planning and generation)

An engraving of a hand with a complex mechanical device attached to the back. The device consists of a central vertical shaft with various gears, levers, and pistons. Numbered parts include: 1. A small figure at the base of the device. 2. A lever on the right side. 3. A piston on the right side. 4. A lever on the left side. 5. A piston on the left side. 6. A small figure at the base of the device. 7. A small figure at the base of the device. 8. A small figure at the base of the device. 9. A small figure at the base of the device. The hand is shown from the back, with the fingers slightly curled. The device is mounted on the wrist and extends up the back of the hand. The engraving is detailed, showing the texture of the skin and the mechanical components.

A portrait of Galileo Galilei, an Italian astronomer, physicist, and engineer, depicted with a long white beard and wearing a dark garment with a white collar.

“

1. A robot may not injure a human being or, through inaction, allow a human being to come to harm.
2. A robot must obey any orders given to it by human beings, except where such orders would conflict with the First Law.
3. A robot must protect its own existence as long as such protection does not conflict with the First or Second Law.
